My Career

As a Full Stack Developer with a strong focus on Backend Development, I specialize in building scalable, high-performance web applications through clean architecture, optimized APIs, and efficient system design. My expertise spans Node.js, Express, PostgreSQL, and TypeORM, with hands-on experience in microservice-inspired architectures, real-time data handling, and secure authentication systems.

At Flyttman, I led backend development for a digital logistics platform, designing modular APIs, optimizing database performance, and implementing real-time job coordination and driver tracking systems improving performance, scalability, and operational automation.

At Ajoo.me, I engineered backend infrastructure for a digital cooperative management platform, supporting multi-role access, real-time analytics, and configurable notifications. My focus on ORM-based modeling, service-layer separation, and robust error handling ensured a maintainable and reliable system foundation.

Driven by continuous learning and technical excellence, I bring a holistic full-stack perspective bridging backend logic with frontend usability to deliver secure, scalable, and production-ready solutions that enhance user experience and system performance.

Work expperience

Backend Developer Northern Reach

Oct 2024 - Aug 2025

Backend Developer | Flyttman

Digital logistics and relocation management platform

Led backend development of a scalable logistics platform, architecting a modular Node.js (Express) and PostgreSQL system with microservice principles. Built robust APIs, optimized database performance (-40% response time via Redis caching and indexing), and implemented real-time features like driver tracking (WebSockets) and automated quotation generation. Implemented secure JWT- and RBAC-based authentication for multiple user roles, and set up CI/CD pipelines with GitHub Actions and Docker for streamlined deployments. Enhanced reliability through centralized logging (Winston) and error tracking (Sentry), and introduced background workers for asynchronous processing.
Delivered a fault-tolerant, extensible backend infrastructure supporting future integrations and high-traffic scalability.

Backend Developer Northern Reach

Feb 2024 - Apr 2024

Backend Developer | Ajoo.me

Digital cooperative management platform

Led backend architecture and service development for a cooperative management platform built with Node.js, Express, TypeORM, and PostgreSQL. Designed normalized relational schemas for complex entities (Cooperatives, Members, Loans, Attendance, Notifications), ensuring efficient queries and referential integrity.
Implemented secure JWT-based authentication with multi-tier RBAC (Associate, Cooperative, Major Cooperative) and middleware for authorization, validation, and global error handling. Developed RESTful APIs powering the Admin Dashboard's analytics, loan tracking, and notification modules. Built key modules including dashboard analytics, configurable notification systems (email/SMS/push), file uploads via Multer, and detailed activity logs for audit trails.
Configured CI-ready deployment environments, integrated Ngrok for remote testing, and ensured consistent error handling across services. Strengthened expertise in API design, ORM-based data modeling, and scalable backend architecture for multi-role web platforms.

Full Stack Developer Northern Reach

Feb 2023 - Apr 2023

Full Stack Developer | Spectrumverse.ng
Digital platform for community engagement and services

Developed and deployed full-stack features using modern JavaScript frameworks, implementing secure authentication and authorization with JWT and protected route handling. Built a robust payment system integrating third-party payment gateways and managing transaction validation and error states.
Engineered complex CRUD operations with efficient backend logic and responsive frontend components, ensuring seamless data flow across the application. Focused on scalability, maintainability, and user experience throughout the development lifecycle.
